# String manipulation with stringr :: **cheat sheet**

The stringr package provides a set of internally consistent tools for working with character strings, i.e. sequences of characters surrounded by quotation marks.

# Detect Matches

#### 1

str\_detect(string, pattern) Detect the
presence of a pattern match in a string.
str\_detect(fruit, "a")

str\_which(string, pattern) Find the indexes of strings that contain a pattern match. str\_which(fruit, "a")

**†** 

str\_count(string, pattern) Count the number of matches in a string. str\_count(fruit, "a")

**†** 

positions of pattern matches in a string. Also **str\_locate\_all**. *str\_locate(fruit, "a")* str\_locate(string, pattern) Locate the

**†** 

## **Subset Strings**

str\_sub(string, start = 1L, end = -1L) Extract substrings from a character vector. str\_sub(fruit, 1, 3); str\_sub(fruit, -2) str\_subset(string, pattern) Return only the strings that contain a pattern match. str\_subset(fruit, "b")

**†** 

Ť

pattern match found in each string, as a vector. Also str\_extract\_all to return every pattern str\_extract(string, pattern) Return the first match. str\_extract(fruit, "[aeiou]")

Z Z

**†** 

str\_match(string, pattern) Return the first pattern match found in each string, as a matrix with a column for each () group pattern. Also **str\_match\_all**. str\_match(sentences, "(a|the) ([^ ]+)")

¥ ¥

# Manage Lengths

number of code points, which generally equals the number of characters). str\_length(fruit) str\_length(string) The width of strings (i.e.

str\_pad(string, width, side = c("left", "right",
"both"), pad = " ") Pad strings to constant
width. str\_pad(fruit, 17) strings, replacing content with ellipsis. str\_trunc(fruit, 3) str\_trim(string, side = c("both", "left", "right"))
Trim whitespace from the start and/or end of a string. str\_trim(fruit)

**†** 

## **Mutate Strings**

str\_sub() <- value. Replace substrings by identifying the substrings with str\_sub() and assigning into the results.</p> str\_sub(fruit, 1, 3) <- "str

str\_replace(string, pattern, replacement)
Replace the first matched pattern in each string. str\_replace(fruit, "a", "-")

**+** 

**†** 

str\_replace\_all(string, pattern, replacement) Replace all matched patterns in each string. str\_replace\_all(fruit, "a", "-")

**+** 

A STRING a string

str\_to\_lower(string, locale = "en")¹ Convert strings to lower case. str\_to\_lower(sentences) str\_to\_upper(string, locale = "en")¹ Convert str\_to\_upper(sentences) strings to upper case.

a string

A STRING

**str\_to\_title**(string, locale = "en") $^1$  Convert strings to title case.  $str\_to\_title(sentences)$ 

# Join and Split

str\_c(..., sep = "", collapse = NULL) Collapse str\_c(..., sep = "", collapse = NULL) Join
multiple strings into a single string. a vector of strings into a single string. str\_c(letters, LETTERS)

str\_dup(string, times) Repeat strings times times.  $str_dup(fruit, times = 2)$ 

str\_c(letters, collapse = "")

**↑** 

str\_split\_fixed(string, pattern, n) Split a vector of strings into a matrix of substrings (splitting at occurrences of a pattern match). Also str\_split to return a list of substrings. str\_split\_fixed(fruit, "", n=2)

ightharpoons

**str\_glue**(..., sep = "", envir = parent.frame()) Create a string from strings and {expressions} to evaluate.  $str_glue("Pi \ is \ pi]")$ 

{xx}

str\_glue\_data(x, ..., .sep = "", .envir =
parent.frame(), .na = "NA") Use a data frame,
list, or environment to create a string from strings and {expressions} to evaluate. str\_glue\_data(mtcars, "{rownames(mtcars)} has {hp} hp")

ŧ

### **Order Strings**

str\_order(x, decreasing = FALSE, na\_last = TRUE, locale = "en", numeric = FALSE, ...)¹ Return the vector of indexes that sorts a character vector. x/str\_order(x)

str\_sort(x, decreasing = FALSE, na\_last = TRUE,
locale = "en", numeric = FALSE, ...)¹ Sort a
character vector.

#### Helpers

str\_conv(string, encoding) Override the encoding of a string. str\_conv(fruit,"ISO-8859-1")

str\_view(string, pattern, match = NA) View HTML rendering of first regex match in each string. str\_view(fruit, "[aeiou]")

banana

apple pear

str\_view\_all(string, pattern, match = NA) View HTML rendering of all regex matches. str\_view\_all(fruit, "[aeiou]") str\_wrap(string, width = 80, indent = 0, exdent = 0) Wrap strings into nicely formatted paragraphs. str\_wrap(sentences, 20)

! See bit.ly/ISO639-1 for a complete list of locales.
